Model Evaluation Log

Nightly regression — intent-classification head v3.2

This run compares the newly fine-tuned intent-classification head against the previous production checkpoint on the held-out validation split. All 12,480 examples were scored under identical decoding settings; no data augmentation was applied, to isolate the effect of the architecture change.

Observations

- Recall improved most on the 'cancel_subscription' and 'refund_request' intents, both previously under-represented in training data.
- Latency increased by roughly 6ms per request, consistent with the added attention head — within the 15ms budget agreed for this release.
- One regression: 'change_address' now confuses with 'update_profile' in 4% of cases, up from 1%.

Metrics

Metric	Previous	Current	Δ
Accuracy	91.2%	93.6%	+2.4
Precision	89.7%	91.8%	+2.1
Recall	87.4%	90.9%	+3.5
Latency (p50)	42ms	48ms	+6

Notes

- Re-run with augmented 'change_address' examples before promoting to canary.
- Flag for review — confusion matrix attached in run artifact MEV-2026-0714.
